SECTION 1: HERO

TAGLINE:
Transforming medicine with precision cell killing

TRICK (Trigger RNA-Induced Cell Killing) is a programmable RNA-targeted platform that is engineered to recognise disease-driving RNA transcripts inside cancer cells and trigger selective cell death, while leaving healthy cells unharmed.

(note: the paragraph above is new)

SECTION 2: Science

HEADLINE:
Reaching Disease Signals Others Cannot

Many of cancer's most important mutations are found inside the cell. Yet most of today's precision therapies, including antibody-drug conjugates and cell therapies, are limited to targets on the cell surface.

This leaves a major gap in precision oncology.

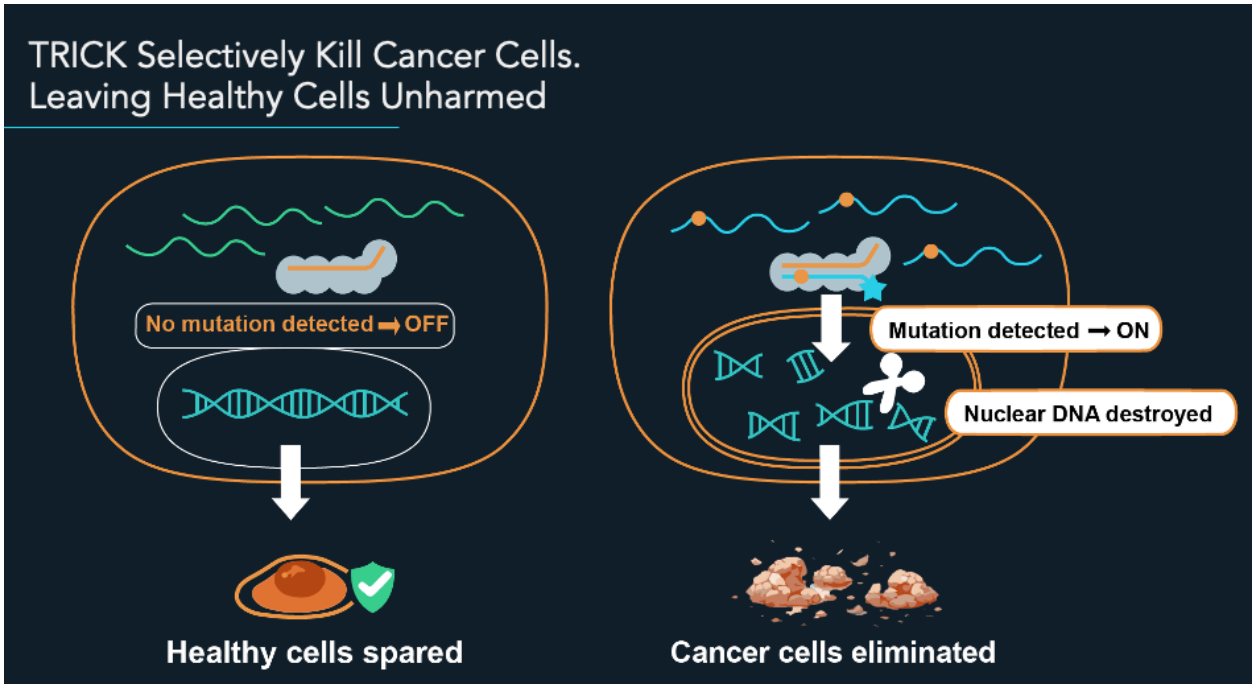
Platypus Bio was created to close that gap.

The TRICK Platform

TRICK -Trigger RNA-induced Cell Killing - is a programmable platform designed to selectively kill cancer cells based on the RNA sequences they express.

Unlike approaches that rely on surface markers alone, TRICK is designed to access the full transcriptome, enabling therapeutic targeting of intracellular disease signals, including mutations that have historically been difficult or impossible to drug.

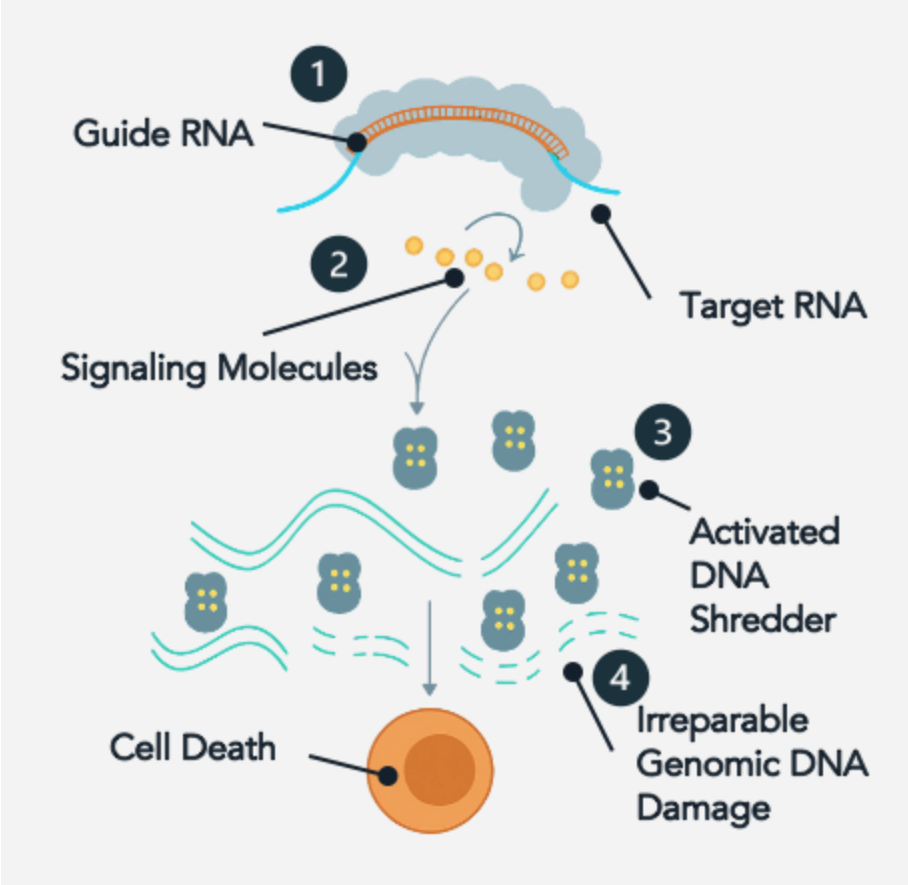
This goes with the text above



How TRICK Works

TRICK uses a guide RNA to identify a target RNA sequence inside the cancer cell with single-nucleotide precision. Once the target RNA is recognized, a conformational change activates production of signaling molecules. These signaling molecules then activate an accessory nuclease - the platform's "DNA Shredder" - which causes irreparable genomic DNA damage and ultimately cell death.

This goes with the text above



TRICK Platform Advantages

Intracellular Targeting
TRICK is designed to reach disease-defining signals inside the cell, unlocking targets beyond the reach of many current precision therapies.

Programmable Design
The platform can be programmed to recognize specific RNA sequences, creating the potential to target defined mutations across cancer types and patient populations.

Multiplexable Architecture
Multiple guide RNAs can be incorporated into a single product, enabling broader patient coverage and reducing the risk of tumor escape.

Durable Cell Killing
By recognizing more than one disease-driving RNA signature, TRICK can target heterogeneous cancer cell populations and make it harder for tumors to evade treatment through single-mutation loss or pathway adaptation.

SECTION 3: Pipeline

HEADLINE: Broad by Design, Focused by Strategy

Platypus Bio's lead program is focused on acute myeloid leukemia, a cancer with high unmet need and strong technical fit for the TRICK platform.

AML is characterized by well-defined genetic mutations, making it an attractive first indication for programmable RNA-guided cell killing. The disease also has significant therapeutic need, with high relapse rates and limited curative options.

SECTION 4: TEAM

SECTION LABEL: OUR TEAM

INTRO:
Our team brings deep expertise in CRISPR biology, translational science, discovery, and therapeutic development, with more than 30 years of collective CRISPR experience across the leadership team.

TEAM CARDS (4 founders):

CO-FOUNDER & CEO
Chris Alma

Serial biotech entrepreneur with deep expertise in commercialisation, venture creation, and capital formation. Committed to taking TRICK from discovery to the clinic.

CO-FOUNDER & CSO
Prof. Peter Fineran

World-leading CRISPR and phage biology researcher. Professor at the University of Otago with 150+ publications. The scientific foundation of the TRICK platform was built in his laboratory.

CO-FOUNDER & CTO
Rob Fagerlund

Pioneer in RNA discovery platforms and metagenomic biology. The computational intelligence behind TRICK's target identification and platform design.

CO-FOUNDER & COO
Simon Jackson

SECTION 6: CONTACT / FOOTER

SECTION LABEL: JOIN THE FRONTIER

BODY:
We are a pre-clinical biotechnology company developing TRICK, a first-in-class programmable CRISPR platform technology that kills cells based upon their transcriptome. The TRICK platform forms the intersection of precision and programmability

If you are a potential investor, pharma partner, or scientific collaborator, we want to hear from you.
